Verfahrenstechnik
Lehrstuhl für Fluideodynamik
Prof. Dr.-Ing. Andreas Kempf

Referent:

GASTVORTRAG

Venkatramanan Raman
Associate Professor
Dept. of Aerospace Engineering and
Engineering Mechanics
The University of Texas at Austin

Thema:

**“Practical Issues in Large Eddy Simulation
of Turbulent Combustion”**

Abstract:

Large eddy simulation (LES) has become a key simulation tool for complex reacting flows. In spite of its success in reproducing experimental flames, several fundamental issues regarding LES formulation and application remain unanswered. In this talk, we will review a key aspect of LES, the coupling between numerical errors and models. It will be shown that numerical errors have first error impact on subfilter modeling, and invalidate the dynamic modeling approach. Strategies for error minimization will be discussed. Finally, a reformulation of LES that will allow a rigorous statistical basis will be introduced.
